Explanations

1.C

Writing down the values given in the candlestick chart in the form of a table for ease of calculation,

Stock	Opening	Close	High	Low
A	2200	1800	2400	1200
B	2000	1700	2000	1400
C	800	1200	1400	800
D	500	1000	1200	300
E	1300	1100	1400	1100
F	1800	1600	2000	1200
G	1200	1700	1900	1000

Daily loss for a share is defined as $(\text{Opening price} - \text{Closing price}) / (\text{Opening price})$

Calculating this for the options:

Stock A: $400/2200=2/11$

Stock B: $300/2000=3/20$

Stock F: $200/1800=1/9$

Stock G gained money that day

Hence Stock A has the highest Daily Loss.

 VIDEO SOLUTION

2.4

Writing down the values given in the candlestick chart in the form of a table for ease of calculation,

Stock	Opening	Close	High	Low
A	2200	1800	2400	1200
B	2000	1700	2000	1400
C	800	1200	1400	800
D	500	1000	1200	300
E	1300	1100	1400	1100
F	1800	1600	2000	1200
G	1200	1700	1900	1000

We are given that, Daily Share Price Variability (SPV) is defined as (Day's high price - Day's low price) / (Average of the opening and closing prices during the day)

Calculating it for the stocks

Stock A: $1200/2000=3/5$

Stock B: $600/1850=60/185$

Stock C: $600/1000=3/5$

Stock D: $900/750=90/75=6/5$

Stock E: $300/1200=1/4$

Stock F: $800/1700=8/17$

Stock G: $900/1450=90/145$

We need to check for stocks greater than 0.5 on that day,

Stock A, Stock C, Stock D, Stock G have SPV greater than 0.5 that day.

Hence, the answer is 4.

 VIDEO SOLUTION

3.C

Writing down the values given in the candlestick chart in the form of a table for ease of calculation,

Stock	Opening	Close	High	Low
A	2200	1800	2400	1200
B	2000	1700	2000	1400
C	800	1200	1400	800
D	500	1000	1200	300
E	1300	1100	1400	1100
F	1800	1600	2000	1200
G	1200	1700	1900	1000

We are given that, Daily Share Price Variability (SPV) is defined as (Day's high price - Day's low price) / (Average of the opening and closing prices during the day)

Calculating it for the four options,

Stock F: $800/1700=8/17$

Stock A: $1200/2000=3/5$

Stock D: $900/750=90/75=6/5$

Stock C: $600/1000=3/5$

Clearly Stock D has the highest SPV.

[VIDEO SOLUTION](#)

4. A

Writing down the values given in the candlestick chart in the form of a table for ease of calculation,

Stock	Opening	Close	High	Low
A	2200	1800	2400	1200
B	2000	1700	2000	1400
C	800	1200	1400	800
D	500	1000	1200	300
E	1300	1100	1400	1100
F	1800	1600	2000	1200
G	1200	1700	1900	1000

There are three bullish shares, C D and G

Lets say a trader buys one share of each of these stocks, and sells them at their day's high

One share of C at opening is 800, sells at 1400

One share of D at opening is 500, 1200

One share of G at opening is 1200, 1900

Total Investment is 2500, and total money after selling is 4500

That is an 80% return since, $\frac{(4500 - 2500)}{2500} = 0.8$

[VIDEO SOLUTION](#)

5. D

We know the following relation that , revenue = volume * ARDT . To have equal value the ratio of revenue by ARDT should be constant.

Considering UK we have volume = 12.5/30 and of Spain we have 6.5/15 which is fairly constant as compared to others.

Hence option D.

[VIEW SOLUTION](#)

 **CAT Important Topics** 

6. E

If the volume of data transfer in India is the same as that of Singapore then we have $(R_i * 7.5 / 0.9) = (20 * R_s / 9.5)$; we get R_s nearly equal to $4 * R_i$.

Hence Total revenue in Singapore is about 4 time that of India.

[VIEW SOLUTION](#)

7. C

Revenue from data transfer as a percentage of total revenue will triple for India and double for Sweden.

Also the total revenue in India is twice that of Sweden.

Taking volume constant we have for India $3 * 0.9 * R_i = ARDT * vol$

For Sweden $0.18 * 2 * R_s = 6 * Vol$

Since vol is constant and $R_i = 2 * R_s$ we have $ARDT = 9$.

Thus % increase in $ARDT = 800\%$.

[VIEW SOLUTION](#)

8. B

The data can be tabulated as follows(approximately):

Parameters	Vendor 1	Vendor 2	Vendor 3	Vendor 4	Vendor 5
Reliability	52	40	75	26	60
Reach	80	58	63	46	70
Quality	72	69	62	40	48
Features	40	45	56	90	75
Customer Services	55	41	50	70	28
Cost	77	81	90	71	50

Top 3 on Reliability: Vendor 3, Vendor 5

Top 3 on Reach: Vendor 1, Vendor 5

Top 3 on Quality: Vendor 1, Vendor 2

Top 3 on Features: Vendor 4, Vendor 5

Top 3 on Customer Services: Vendor 4, Vendor 1

Top 3 on Cost: Vendor 3, Vendor 2

Vendor 1: 3 times Vendor 2: Only once Vendor 3: 2 times Vendor 4: 2 times Vendor 5: 3 times

Here 1 and 5 comes 3 times. Hence B is the answer.

[VIDEO SOLUTION](#)

9. D

The data can be tabulated as follows(approximately):

Parameters	Vendor 1	Vendor 2	Vendor 3	Vendor 4	Vendor 5
Reliability	52	40	75	26	60
Reach	80	58	63	46	70
Quality	72	69	62	40	48
Features	40	45	56	90	75
Customer Services	55	41	50	70	28
Cost	77	81	90	71	50
Total	376	334	396	343	321

The average of the vendor will be highest which has highest total score. Hence vendor 3 has the highest average.

[VIDEO SOLUTION](#)

10. A

The data can be tabulated as follows(approximately):

Parameters	Vendor 1	Vendor 2	Vendor 3	Vendor 4	Vendor 5
Reliability	52	40	75	26	60
Reach	80	58	63	46	70
Quality	72	69	62	40	48
Features	40	45	56	90	75
Customer Services	55	41	50	70	28
Cost	77	81	90	71	50

Customer Services: 28,41,50,55,70 (The median is 50)

Cost: 50,71,77,81,90 (The median is 77)

Reliability: 26, 40, 52, 60, 75 (The median is 52)

Quality: 40, 48, 62, 69, 72 (The median is 62)

Features: 40, 45, 56, 75, 90 (The median is 56)

Reach: 46, 58, 63, 70, 80 (The median is 63)

Hence the customer services has the lowest median.

11. C

The data can be tabulated as follows (approximately):

Parameters	Vendor 1	Vendor 2	Vendor 3	Vendor 4	Vendor 5
Reliability	52	40	75	26	60
Reach	80	58	63	46	70
Quality	72	69	62	40	48
Features	40	45	56	90	75
Customer Services	55	41	50	70	28
Cost	77	81	90	71	50

Top 3 on Reliability: Vendor 3, Vendor 5, Vendor 1

Top 3 on Reach: Vendor 1, Vendor 5, Vendor 3

Top 3 on Quality: Vendor 1, Vendor 2, Vendor 3

Top 3 on Features: Vendor 4, Vendor 5, Vendor 3

Top 3 on Customer Services: Vendor 4, Vendor 1, Vendor 3

Top 3 on Cost: Vendor 3, Vendor 2, Vendor 1

Only Vendor 3 ranks among top 3 in all the six parameters.

[VIDEO SOLUTION](#)

12. C

Total sales = $150 \times 40 = 6000$. Total costs = $2000 + 3650$ (approx). = 5600 to 5700. Hence, profit = $6000 - 5600 = 400$ (approx). Hence option C.

[VIEW SOLUTION](#)

13. C

For 40 units total fixed costs would be $1200 + 800 = 2000$ and variable cost = 3700. So total cost = 5700 (approx). Hence approximate average unit cost for July = $5700 / 40 = 142.5$. Hence option C is the correct answer.

[VIEW SOLUTION](#)

14. D

When we take some value and check for the variation, we find that actual variation is opposite to that of option C.

Upto a certain level, AC is greater than MC and then AC is less than MC.

For producing 31 units, the average cost is $1200 + 800 + 2400 = \text{Rs. } 4400$.

Average cost = $4400/31 = \text{Rs. } 142$ (Approx).

Let us calculate the marginal cost at this point.

As the number of units increases from 31 to 40, the variable cost increases from Rs.2400 to Rs.3700.

Marginal cost = $(3700-2400)/10 = 1300/10 = \text{Rs. } 130$.

$MC < AC$ for 31 units.

Let us calculate MC and AC for 60 units.

Average cost = $(2000 + 6800)/60 = 8800/60 = \text{Rs. } 146.66$

As the number of units increases from 50 to 60, the variable cost increases from Rs.5000 to Rs.6800.

Marginal cost = $\text{Rs. } 1800/10 = \text{Rs. } 180$

$MC > AC$ for 60 units.

As we can see, the trend is the inverse of what is mentioned in option C. Since none of the options capture the trend precisely, option D is the right answer.

[VIEW SOLUTION](#)

15. A

As adding a shift dramatically increases the costs, we need to consider the two regions, $0 < x \leq 30$ and $30 < x \leq 60$, separately.

Region 1: As variable cost is less than equal to 100, and sales price is 150, profit would be max when production is maximum possible i.e. at 30 units.

Hence, at 30 units, total cost = $800 + 2400 = 3200$. Sales = $30 * 150 = 4500$. Profit = $4500 - 3200 = 1300$

Region 2: As variable cost is less than equal to 100, and sales price is 150, profit would be max when production is maximum possible i.e. at 60 units

Hence, at 60 units, total cost = $800 + 1200 + 6500 = 8500$. Sales = $150 * 60 = 9000$. Hence, Profit = $9000 - 8500 = 500$

Hence, profit is maximum at 30 units.

[VIEW SOLUTION](#)

A promotional banner for CAT Mock Tests. On the left, there is a photo of two people, a man and a woman, both wearing black t-shirts with 'cracku' written on them. To their right, the text 'CAT Mock Test' is written in large, bold, blue letters. Below this, a yellow box contains the text 'Mocks designed exactly like the actual CAT'. On the far right, there is a small illustration of a desk with a lamp, a clock, and some books, with the word 'MOCK' written above it. The 'cracku' logo is in the top right corner.

16. A

As the graph is an increasing function, MC will always increase for increase in number of units.

[VIEW SOLUTION](#)

17. B

We know that MC is the rate of change in total cost for unit change in quantity produced. SO for 40 units total cost = $2000 + 3700 = 5700$ and for 50 units = $2000 + 5000 = 7000$. So for additional 10 units change in total costs is 1300 . So for 1 unit we have $MC = 130$.

[VIEW SOLUTION](#)

18. D

The fertilizer and food production has been inversely proportional over the years. ie when food production increased, fertilizer production fell and vice versa. But as we can see in 1988-89, when food production remained constant, the fertilizer production fell steeply and in 89-90 when food production increased steeply, the fertilizer production stayed constant. So, 1989 is the year of the anomaly.

[VIEW SOLUTION](#)

19. D

Just by looking at the graphs of the previous year's it is difficult to guess how the food production in the year 1992 will be.

This is especially true as we don't have any information about the fertilizer production in the year 1992.

Hence, the correct answer is option (d)

[VIEW SOLUTION](#)

20. C

From the graph, in the year 1988, the ratio of food production to fertilizer production is 5:3.5 i.e 10:7
Let the food production be $10X$ and the fertilizer production be $7X$

Hence, the total is $10X + 7X = 17X$ which equals 170

So, $X = 10$ and the total food production equals $10 \times 10 = 100$

[VIEW SOLUTION](#)

21. D

In order to find the number of years for which the sum is same, we need to determine the change in production of food and fertilizer. If there is no effective change, then the sum of their productions is same.

Change in 1984 $\Rightarrow +1 - 1.5 = -0.5$

Change in 1985 $\Rightarrow 0$

Change in 1986 $\Rightarrow -1.5 + 1.5 = 0$

Change in 1987 $\Rightarrow 0$

Change in 1988 $\Rightarrow +1.5 - 1.5 = 0$

Change in 1989 $\Rightarrow -2.5 + 0 = -2.5$

Change in 1990 $\Rightarrow 0 + 1.5 = 1.5$

Change in 1991 $\Rightarrow 0$

The change is 0 in 5 years. Hence, the answer is option D.

[VIEW SOLUTION](#)

22. B

Let each unit in the scale be equal to X

So, fertilizer production in 1983 is $2.5X$
 So, fertilizer production in 1984 is $3.5X$
 So, fertilizer production in 1985 is $3.5X$
 So, fertilizer production in 1986 is $2X$
 So, fertilizer production in 1987 is $2X$
 So, fertilizer production in 1988 is $3.5X$
 Assuming fertilizer production in 1989 is same as that of 1988 it equals $3.5X$
 So, fertilizer production in 1990 is X
 So, fertilizer production in 1991 is X
 Hence, the total is $22.5X$
 But this equals 450 million tonnes. Hence, $X = 20$ million tonnes
 Therefore, food production in 1983 = $6.5X$ equals 130 million tonnes

[VIEW SOLUTION](#)

23. B

Let us divide the given figure in four quadrants (Q1, Q2, Q3, Q4).

Let us solve this problem by considering only one category at a time.

(A) Blockbuster category: We have two information regarding Blockbuster category.

1. Alfa and Bravo had the same number of products in the Blockbuster category.

There are a total of 7 products in Blockbuster category. Alfa already has two products in blockbuster category. If Alfa has 3 products in blockbuster category then Bravo will also have 3 products in Blockbuster category which is not possible as there are 2 products of Charlie. Hence, we can say that Alfa and Bravo have 2 products each in Blockbuster category whereas Charlie has 3 products in Blockbuster category.

2. It is also given that Charlie had a higher revenue than Bravo from products in the Blockbuster category.

We know that one of the product 1 and 2 is from Charlie and the other is from Bravo.

If product 1 is from Charlie, then we can say that products 1, 7 and 5 are from Charlie. Therefore, revenue generated by products in Charlie category = $2 + 4 + 6 = 12$ units. (Assuming area of a square to be 1 unit)

In this case product 2 and product n are from Bravo. Therefore, revenue generated by products in Bravo category = $6 + 9 = 15$ units.

We can see that products from Charlie have a higher revenue than Bravo. Hence, this case is not possible.

Therefore, we can say that Product 1 is from Bravo and Product 2 is from Charlie. We have determined each product's company name in Blockbuster category.

(B) No-hope category: We have two information regarding No-hope category.

(1) Charlie had more products than Bravo but fewer products than Alfa in the No-hope category. Bravo and Charlie had the same revenue from products in the No-hope category. There are a total of 6 products in no-hope category.

Therefore, we can say that Alfa, Charlie and Bravo have 3, 2 and 1 products in No-hope category in that order.

Bravo and Charlie had the same revenue from products in the No-hope category.

Revenue generated for Bravo in the No-hope category = 4 units. We need same revenue for Charlie which has 2 products in this category. Hence, we can say that Product 10 and one of product 8 and 9 is from Charlie and other is from Alfa. Let's assume that product 8 is from Charlie and product 9 is from Alfa.

(C) Doubtful category: We have two information regarding Doubtful category.

(1). Charlie did not have any product in the Doubtful category, while Alfa had one product more than Bravo in this category.

(2). Bravo had a higher revenue than Alfa from products in the Doubtful category.

We can see that there are a total of 7 products in this category. Hence, we can say that 4 products are from Alfa and 3 products are from Bravo.

We can see that one of product 14, 15 and 16 is from Bravo company and others are from Alfa company. Bravo will have higher revenue than Alfa only when product no. 14 is from Bravo and others (15 and 16) are from Alfa category.

In this case total revenue by Bravo = Product 14 + Product 19 + Product 20 = 9 + 6 + 2 = 17

Similarly, total revenue by Charlie = Product 15 + Product 16 + Product 17 + Product 18 = 6 + 1 + 1 + 4 = 12

(D) Promising category: We have only 1 direct information regarding Promising category.

1. Each company had an equal number of products in the Promising category.

There are a total of 3 products in promising category with different revenue. Therefore, we can say that each company had 1 product in promising category. We are given that Alfa and Charlie had the same total revenue considering all products. We can calculate the revenue generated by Alfa and Charlie from the products in categories.

Revenue generated by Charlie from all categories except Promising = From Blockbuster + From No-hope + From Doubtful

$$\Rightarrow (9+6+2) + (3+1) + (0) = 21 \text{ units}$$

Revenue generated by Alfa from all categories except Promising = From Blockbuster + From No-hope + From Doubtful

$$\Rightarrow (6+3) + (4+2+1) + (1+6+4+1) = 28 \text{ units}$$

We can see the difference between revenue generated by Charlie and Alfa from remaining categories is 7 units. Hence, we can say that Charlie's product's revenue should be 7 units more than Alfa's product's revenue in Promising category. That is possible only in one case where product 22 is from Charlie and product 21 is from Alfa. Consequently, we can say that product 23 is from Bravo. Now we have identified each product's company name we can answer all the questions.

Let us check all options.

Option (A): Alfa's revenue from Blockbuster products was the same as Charlie's revenue from Promising products

Alfa's revenue from Blockbuster products = $6 + 3 = 9$ units.

Charlie's revenue from Promising products = 9 units. Hence, this statement is **true**.

Option (B): Bravo's revenue from Blockbuster products was greater than Alfa's revenue from Doubtful products.

Bravo's revenue from Blockbuster products = $6 + 4 = 10$ units.

Alfa's revenue from Doubtful products = $6 + 4 + 1 + 1 = 12$ units. Hence, this statement is **false**.

Option (C): Bravo and Charlie had the same revenues from No-hope products.

Bravo's revenue from No-hope products = 4 units.

Charlie's revenue from No-hope products = $3 + 1 = 4$ units. Hence, this statement is **true**.

Option (D): The total revenue from No-hope products was less than the total revenue from Doubtful products

Revenue generated by the products in Doubtful category = $1 + 9 + 4 + 6 + 2 + 1 + 6 = 29$ units.

Revenue generated by the products in No-hope category = $4 + 4 + 3 + 2 + 1 + 1 = 15$ units. Hence, this statement is **true**.

We can see that statement mentioned in option B is false. Therefore, option B is the correct answer.

VIDEO SOLUTION

24. B

Let us divide the given figure in four quadrants (Q1, Q2, Q3, Q4).

Let us solve this problem by considering only one category at a time.

(A) Blockbuster category: We have two information regarding Blockbuster category.

1. Alfa and Bravo had the same number of products in the Blockbuster category.

There are a total of 7 products in Blockbuster category. Alfa already has two products in blockbuster category. If Alfa has 3 products in blockbuster category then Bravo will also have 3 products in Blockbuster category which is not possible as there are 2 products of Charlie. Hence, we can say that Alfa and Bravo have 2 products each in Blockbuster category whereas Charlie has 3 products in Blockbuster category.

2. It is also given that Charlie had a higher revenue than Bravo from products in the Blockbuster category.

We know that one of the product 1 and 2 is from Charlie and the other is from Bravo.

If product 1 is from Charlie, then we can say that products 1, 7 and 5 are from Charlie. Therefore, revenue generated by products in Charlie category = $2 + 4 + 6 = 12$ units. (Assuming area of a square to be 1 unit)

In this case product 2 and product 4 are from Bravo. Therefore, revenue generated by products in Bravo category = $6 + 9 = 15$ units.

We can see that products from Charlie have a higher revenue than Bravo. Hence, this case is not possible.

Therefore, we can say that Product 1 is from Bravo and Product 2 is from Charlie. We have determined each product's company name in Blockbuster category.

(B) No-hope category: We have two information regarding No-hope category.

(1) Charlie had more products than Bravo but fewer products than Alfa in the No-hope category. Bravo and Charlie had the same revenue from products in the No-hope category. There are a total of 6 products in no-hope category.

Therefore, we can say that Alfa, Charlie and Bravo have 3, 2 and 1 products in No-hope category in that order.

Bravo and Charlie had the same revenue from products in the No-hope category.

Revenue generated for Bravo in the No-hope category = 4 units. We need same revenue for Charlie which has 2 products in this category. Hence, we can say that Product 10 and one of product 8 and 9 is from Charlie and other is from Alfa. Let's assume that product 8 is from Charlie and product 9 is from Alfa.

(C) Doubtful category: We have two information regarding Doubtful category.

(1). Charlie did not have any product in the Doubtful category, while Alfa had one product more than Bravo in this category .

(2). Bravo had a higher revenue than Alfa from products in the Doubtful category.

We can see that there are a total of 7 products in this category. Hence, we can say that 4 products are from Alfa and 3 products are from Bravo.

We can see that one of product 14, 15 and 16 is from Bravo company and others are from Alfa company. Bravo will have higher revenue than Alfa only when product no. 14 is from Bravo and others (15 and 16) are from Alfa category.

In this case total revenue by Bravo = Product 14 + Product 19 + Product 20 = 9 + 6 + 2 = 17

Similarly, total revenue by Charlie = Product 15 + Product 16 + Product 17 + Product 18 = 6 + 1 + 1 + 4 = 12

(D) Promising category: We have only 1 direct information regarding Promising category.

1. Each company had an equal number of products in the Promising category.

There are a total of 3 products in promising category with different revenue. Therefore, we can say that each company had 1 product in promising category. We are given that Alfa and Charlie had the same total revenue considering all products. We can calculate the revenue generated by Alfa and Charlie from the products in categories.

Revenue generated by Charlie from all categories except Promising = From Blockbuster + From No-hope + From Doubtful

$$\Rightarrow (9+6+2) + (3+1) + (0) = 21 \text{ units}$$

Revenue generated by Alfa from all categories except Promising = From Blockbuster + From No-hope + From Doubtful

$$\Rightarrow (6+3) + (4+2+1) + (1+6+4+1) = 28 \text{ units}$$

We can see the difference between revenue generated by Charlie and Alfa from remaining categories is 7 units. Hence, we can say that Charlie's product's revenue should be 7 units more than Alfa's product's revenue in Promising category. That is possible only in one case where product 22 is from Charlie and product 21 is from Alfa. Consequently, we can say that product 23 is from Bravo. Now we have identified each product's company name we can answer all the questions.

Revenue generated by the products in Promising category = 2 + 9 + 3 = 14 units.

Revenue generated by the products in Doubtful category = 1 + 9 + 4 + 6 + 2 + 1 + 6 = 29 units.

Revenue generated by the products in No-hope category = $4 + 4 + 3 + 2 + 1 + 1 = 15$ units.

Revenue generated by the products in Blockbuster category = $6 + 3 + 6 + 2 + 4 + 6 + 9 = 36$ units.

We can see that the revenue generated is the highest for Blockbuster category. Hence, option B is the correct answer.

VIDEO SOLUTION

25. A

Let us divide the given figure in four quadrants (Q1, Q2, Q3, Q4).

Let us solve this problem by considering only one category at a time.

(A) Blockbuster category: We have two information regarding Blockbuster category.

1. Alfa and Bravo had the same number of products in the Blockbuster category.

There are a total of 7 products in Blockbuster category. Alfa already has two products in blockbuster category. If Alfa has 3 products in blockbuster category then Bravo will also have 3 products in Blockbuster category which is not possible as there are 2 products of Charlie. Hence, we can say that Alfa and Bravo have 2 products each in Blockbuster category whereas Charlie has 3 products in Blockbuster category.

2. It is also given that Charlie had a higher revenue than Bravo from products in the Blockbuster category.

We know that one of the product 1 and 2 is from Charlie and the other is from Bravo.

If product 1 is from Charlie, then we can say that products 1, 7 and 5 are from Charlie. Therefore, revenue generated by products in Charlie category = $2 + 4 + 6 = 12$ units. (Assuming area of a square to be 1 unit)

In this case product 2 and product n are from Bravo. Therefore, revenue generated by products in Bravo category = $6 + 9 = 15$ units.

We can see that products from Charlie have a higher revenue than Bravo. Hence, this case is not possible.

Therefore, we can say that Product 1 is from Bravo and Product 2 is from Charlie. We have determined each product's company name in Blockbuster category.

(B) No-hope category: We have two information regarding No-hope category.

(1) Charlie had more products than Bravo but fewer products than Alfa in the No-hope category. Bravo and Charlie had the same revenue from products in the No-hope category. There are a total of 6 products in no-hope category.

Therefore, we can say that Alfa, Charlie and Bravo have 3, 2 and 1 products in No-hope category in that order.

Bravo and Charlie had the same revenue from products in the No-hope category.

Revenue generated for Bravo in the No-hope category = 4 units. We need same revenue for Charlie which has 2 products in this category. Hence, we can say that Product 10 and one of product 8 and 9 is from Charlie and other is from Alfa. Let's assume that product 8 is from Charlie and product 9 is from Alfa.

(C) Doubtful category: We have two information regarding Doubtful category.

(1). Charlie did not have any product in the Doubtful category, while Alfa had one product more than Bravo in this category.

(2). Bravo had a higher revenue than Alfa from products in the Doubtful category.

We can see that there are a total of 7 products in this category. Hence, we can say that 4 products are from Alfa and 3 products are from Bravo.

We can see that one of product 14, 15 and 16 is from Bravo company and others are from Alfa company. Bravo will have higher revenue than Alfa only when product no. 14 is from Bravo and others (15 and 16) are from Alfa category.

In this case total revenue by Bravo = Product 14 + Product 19 + Product 20 = 9 + 6 + 2 = 17

Similarly, total revenue by Charlie = Product 15 + Product 16 + Product 17 + Product 18 = 6 + 1 + 1 + 4 = 12

(D) Promising category: We have only 1 direct information regarding Promising category.

1. Each company had an equal number of products in the Promising category.

There are a total of 3 products in promising category with different revenue. Therefore, we can say that each company had 1 product in promising category. We are given that Alfa and Charlie had the same total revenue considering all products. We can calculate the revenue generated by Alfa and Charlie from the products in categories.

Revenue generated by Charlie from all categories except Promising = From Blockbuster + From No-hope + From Doubtful

$$\Rightarrow (9+6+2) + (3+1) + (0) = 21 \text{ units}$$

Revenue generated by Alfa from all categories except Promising = From Blockbuster + From No-hope + From Doubtful

$$\Rightarrow (6+3) + (4+2+1) + (1+6+4+1) = 28 \text{ units}$$

We can see the difference between revenue generated by Charlie and Alfa from remaining categories is 7 units. Hence, we can say that Charlie's product's revenue should be 7 units more than Alfa's product's revenue in Promising category. That is possible only in one case where product 22 is from Charlie and product 21 is from Alfa. Consequently, we can say that product 23 is from Bravo. Now we have identified each product's company name we can answer all the questions.

Bravo had in No-hope, Doubtful, Promising and Blockbuster categories respectively = 1, 3, 1, 2. Hence, option A is the correct answer.

VIDEO SOLUTION

26. C

Let us divide the given figure in four quadrants (Q1, Q2, Q3, Q4).

Let us solve this problem by considering only one category at a time.

(A) Blockbuster category: We have two information regarding Blockbuster category.

1. Alfa and Bravo had the same number of products in the Blockbuster category.

2. It is also given that Charlie had a higher revenue than Bravo from products in the Blockbuster category.

In this case product 2 and product n are from Bravo. Therefore, revenue generated by products in Bravo category = $6 + 9 = 15$ units.

Therefore, we can say that Product 1 is from Bravo and Product 2 is from Charlie. We have determined each product's company name in Blockbuster category.

(1) Charlie had more products than Bravo but fewer products than Alfa in the No-hope category. Bravo and Charlie had the same revenue from products in the No-hope category. There are a total of 6 products in no-hope category.

Bravo and Charlie had the same revenue from products in the No-hope category.

(C) Doubtful category: We have two information regarding Doubtful category.

(2). Bravo had a higher revenue than Alfa from products in the Doubtful category.

We can see that there are a total of 7 products in this category. Hence, we can say that 4 products are from Alfa and 3 products are from Bravo.

We can see that one of product 14, 15 and 16 is from Bravo company and others are from Alfa company. Bravo will have higher revenue than Alfa only when product no. 14 is from Bravo and others (15 and 16) are from Alfa category.

In this case total revenue by Bravo = Product 14 + Product 19 + Product 20 = $9 + 6 + 2 = 17$

Similarly, total revenue by Charlie = Product 15 + Product 16 + Product 17 + Product 18 = $6 + 1 + 1 + 4 = 12$

(D) Promising category: We have only 1 direct information regarding Promising category.

1. Each company had an equal number of products in the Promising category.

There are a total of 3 products in promising category with different revenue. Therefore, we can say that each company had 1 product in promising category. We are given that Alfa and Charlie had the same total revenue considering all products. We can calculate the revenue generated by Alfa and Charlie from the products in categories.

Revenue generated by Charlie from all categories except Promising = From Blockbuster + From No-hope + From Doubtful

$$\Rightarrow (9+6+2) + (3+1) + (0) = 21 \text{ units}$$

Revenue generated by Alfa from all categories except Promising = From Blockbuster + From No-hope + From Doubtful

$$\Rightarrow (6+3) + (4+2+1) + (1+6+4+1) = 28 \text{ units}$$

We can see the difference between revenue generated by Charlie and Alfa from remaining categories is 7 units. Hence, we can say that Charlie's product's revenue should be 7 units more than Alfa's product's revenue in Promising category. That is possible only in one case where product 22 is from Charlie and product 21 is from Alfa. Consequently, we can say that product 23 is from Bravo. Now we have identified each product's company name we can answer all the questions.

Total revenue generated by Bravo products alone = From Blockbuster + From No-hope + From Doubtful + From Promising

$$\Rightarrow (6+4) + (4) + (9+6+2) + (3) = 34 \text{ units}$$

One box is equivalent to Rs. 1 crore therefore, we can say that total revenue generated by Bravo = Rs. 34 crores. Hence, option C is the correct answer.

[VIDEO SOLUTION](#)

27. C

Take a look at the table,

The low producing areas corresponding to Crop 1 is R9, R10, R11

Now medium yield area corresponding to Crop 3 is R9 and high yield are corresponding to crop 4 is R10 and R11.

Hence all three area are mentioned in the above two categories.

[VIEW SOLUTION](#)

28. D

High quality crop 2 is produced by R5, R8 and R12.

None of these regions produce crop 3.

Hence, option D is true.

None of the other options are true.

[VIEW SOLUTION](#)

29. **B**

It can be seen that region 9 produce medium qualities of Crop-1 or Crop-2 and also produce low quality of Crop-3 or Crop-4.

[VIEW SOLUTION](#)

30. **C**

The values given in both charts together are represented in the table below, with the import tariff percentages charged by each of the five countries on the others represented as a percentage, and the import tariffs levied by each country on other countries are represented in brackets(in billion USD).

	US	France	India	Japan	UK
US		20% (6)	40% (4.5)	30% (7)	30% (3)
France	30% (5.5)		40% (6.5)	30% (4)	40% (4.5)
India	40% (9)	50% (5)		50% (3.5)	20% (5)
Japan	40% (4)	30% (3)	50% (8)		40% (3)
UK	20% (2.5)	30% (4)	30% (3)	40% (6)	

Japan's export to India would be the same as India's import from Japan.

India is charging a 50% tariff on Japan, and the tariff by India on Japan equals 3.5 billion USD.

So, 50% of the imports equals 3.5 billion USD.

$$\frac{50}{100} \times \text{Imports} = 3.5$$

$$\text{Imports} = 3.5 \times 2 = 7 \text{ billion USD.}$$

The value of imports by India from Japan = Japan's export to India = 7 billion USD.

Hence, the correct answer is option C.

[VIEW SOLUTION](#)

CAT Syllabus PDF

31. **B**

The values given in both charts together are represented in the table below, with the import tariff percentages charged by each of the five countries on the others represented as a percentage, and the import tariffs levied by each country on other countries are represented in brackets(in billion USD).

	US	France	India	Japan	UK
US		20% (6)	40% (4.5)	30% (7)	30% (3)
France	30% (5.5)		40% (6.5)	30% (4)	40% (4.5)
India	40% (9)	50% (5)		50% (3.5)	20% (5)
Japan	40% (4)	30% (3)	50% (8)		40% (3)
UK	20% (2.5)	30% (4)	30% (3)	40% (6)	

Option A) Exports by Japan to the UK would be the same as the UK's imports from Japan.

The UK is charging a 40% tariff on Japan, and the tariff imposed by the UK on Japan equals 6 billion USD.

So, 40% of the imports equals 6 billion USD.

$$\frac{40}{100} \times \text{Imports} = 6$$

$$\text{Imports} = 3 \times 5 = 15 \text{ billion USD.}$$

The value of imports by the UK from Japan = Japan's export to the UK = 15 billion USD.

Option B) Imports by the US from France.

The US is charging a 20% tariff on France, and the tariff by the US on France equals 6 billion USD.

So, 20% of the imports equals 6 billion USD.

$$\frac{20}{100} \times \text{Imports} = 6$$

$$\text{Imports} = 6 \times 5 = 30 \text{ billion USD.}$$

The value of imports by the US from France = 30 billion USD.

Option C) Exports by France to Japan would be the same as Japan's imports from France.

Japan is charging a 30% tariff on France, and the tariff by Japan on France equals 3 billion USD.

So, 30% of the imports equals 3 billion USD.

$$\frac{30}{100} \times \text{Imports} = 3$$

$$\text{Imports} = 1 \times 10 = 10 \text{ billion USD.}$$

The value of imports by Japan from France = France's export to Japan = 10 billion USD.

Option D) Imports by France from India.

France is charging a 40% tariff on India, and the tariff by France on India equals 6.5 billion USD.

So, 40% of the imports equals 6.5 billion USD.

$$\frac{40}{100} \times \text{Imports} = 6.5$$

$$\text{Imports} = 6.5 \times 2.5 = 16.25 \text{ billion USD.}$$

The value of imports by France from India = 16.25 billion USD.

Out of all the options, the value of imports by the US from France is the highest.

Hence, the correct answer is option B.

[VIEW SOLUTION](#)

32. D

The values given in both charts together are represented in the table below, with the import tariff percentages charged by each of the five countries on the others represented as a percentage, and the import tariffs levied by each country on other countries are represented in brackets(in billion USD).

	US	France	India	Japan	UK
US		20% (6)	40% (4.5)	30% (7)	30% (3)
France	30% (5.5)		40% (6.5)	30% (4)	40% (4.5)
India	40% (9)	50% (5)		50% (3.5)	20% (5)
Japan	40% (4)	30% (3)	50% (8)		40% (3)
UK	20% (2.5)	30% (4)	30% (3)	40% (6)	

For France - Trade surplus/trade deficit of France with the US = Exports from France to the US - Imports from the US to France

Exports by France to the US would be the same as the US's imports from France.

The US is charging a 20% tariff on India, and the tariff imposed by the US on France equals 6 billion USD.

So, 20% of the imports equals 6 billion USD.

$$\frac{20}{100} \times \text{Imports} = 6$$

$$\text{Imports} = 6 \times 5 = 30 \text{ billion USD.}$$

The value of imports by the US from France = France's export to the US = 30 billion USD.

Imports by France from the US can be calculated as,

France is charging a 30% tariff on the US, and the tariff imposed by France on the US equals 5.5 billion USD.

So, 30% of the imports equals 5.5 billion USD.

$$\frac{30}{100} \times \text{Imports} = 5.5$$

$$\text{Imports} = 5.5 \times 3.34 = 18.34 \text{ billion USD.}$$

The value of imports by France from the US = 18.34 billion USD.

We can clearly see that the Imports are less than the exports for France from the US. So, the trade surplus can be calculated as,

$$\text{Trade surplus} = \text{Exports from France to the US} - \text{Imports from France to the US} = 30 \text{ billion USD} - 18.34 \text{ billion USD} = 11.67 \text{ billion USD.}$$

So, there is a surplus of 11.67 billion USD.

For the UK - The Trade surplus/trade deficit of the UK with the US = Exports from the UK to the US - Imports from the US to the UK

Exports by the UK to the US would be the same as the US's imports from the UK.

The US is charging a 30% tariff on the UK, and the tariff imposed by the US on the UK equals 3 billion USD.

So, 30% of the imports equals 3 billion USD.

$$\frac{30}{100} \times \text{Imports} = 3$$

$$\text{Imports} = 1 \times 10 = 10 \text{ billion USD.}$$

The value of imports by the US from the UK = The UK's export to the US = 10 billion USD.

Imports by the UK from the US can be calculated as,

The UK is charging a 20% tariff on the US, and the tariff imposed by the UK on the US equals 2.5 billion USD.

So, 20% of the imports equals 2.5 billion USD.

$$\frac{20}{100} \times \text{Imports} = 2.5$$

$$\text{Imports} = 2.5 \times 5 = 12.5 \text{ billion USD.}$$

The value of imports by the UK from the US = 12.5 billion USD.

We can clearly see that the Imports are greater than the exports for the UK from the US. So, the trade deficit can be calculated as,

$$\text{Trade deficit} = \text{Exports from the UK to the US} - \text{Imports from the UK to the US} = 10 \text{ billion USD} - 12.5 \text{ billion USD} = -2.5 \text{ billion USD.}$$

So, there is a deficit of 2.5 billion USD.

We can see that France has a surplus and the UK has a deficit with the UK.

Hence, the correct answer is option D.

 [VIEW SOLUTION](#)

33. B

The values given in both charts together are represented in the table below, with the import tariff percentages charged by each of the five countries on the others represented as a percentage, and the import tariffs levied by each country on other countries are represented in brackets(in billion USD).

	US	France	India	Japan	UK
US		20% (6)	40% (4.5)	30% (7)	30% (3)
France	30% (5.5)		40% (6.5)	30% (4)	40% (4.5)
India	40% (9)	50% (5)		50% (3.5)	20% (5)
Japan	40% (4)	30% (3)	50% (8)		40% (3)
UK	20% (2.5)	30% (4)	30% (3)	40% (6)	

Trade surplus/trade deficit of India with the UK = Exports from India to the UK - Imports from India to the UK.
Exports by India to the UK would be the same as the UK's imports from India.

The UK is charging a 30% tariff on India, and the tariff imposed by the UK on India equals 3 billion USD.

So, 30% of the imports equals 3 billion USD.

$$\frac{30}{100} \times \text{Imports} = 3$$

$$\text{Imports} = 1 \times 10 = 10 \text{ billion USD.}$$

The value of imports by the UK from India = India's export to the UK = 10 billion USD.

Imports by India from the UK can be calculated as,

India is charging a 20% tariff on the UK, and the tariff imposed by India on the UK equals 5 billion USD.

So, 20% of the imports equals 5 billion USD.

$$\frac{20}{100} \times \text{Imports} = 5$$

$$\text{Imports} = 5 \times 5 = 25 \text{ billion USD.}$$

The value of imports by India from the UK = 25 billion USD.

We can clearly see that the Imports are greater than the exports for India from the UK. So, the trade deficit can be calculated as,

Trade deficit = Exports from India to the UK - Imports from India to the UK = 10 billion USD - 25 billion USD = -15 billion USD.

So, there is a deficit of 15 billion USD.

Hence, the correct answer is option B.

[VIEW SOLUTION](#)

34. D

It is given,

	Revenue			Cost incurred		
Company	2019	2020	2021	2019	2020	2021
A	90	90	60	85	65	30
B	100	90	30	75	40	30
C	25	70	100	20	60	30
D	50	20	70	40	50	70

Company A:

Revenue = 240 and cost incurred = 180

Profit = 240 - 180 = 60

Company B:

Revenue = 220 and cost incurred = 145

$$\text{Profit} = 220 - 145 = 75$$

Company C:

$$\text{Revenue} = 195 \text{ and cost incurred} = 110$$

$$\text{Profit} = 195 - 110 = 85$$

Company D:

$$\text{Revenue} = 140 \text{ and cost incurred} = 160$$

No profit.

Company C had the highest annual profit.

The answer is option D.

[VIDEO SOLUTION](#)

35. D

Company	Revenue			Cost incurred		
	2019	2020	2021	2019	2020	2021
A	90	90	60	85	65	30
B	100	90	30	75	40	30
C	25	70	100	20	60	30
D	50	20	70	40	50	70

For all the companies in all three years, cost incurred is less than Revenue except for D in 2020.

Revenue is 20 and cost incurred is 50

Company D experienced the highest annual loss in 2020.

The answer is option D.

[VIDEO SOLUTION](#)

36. A

It is given,

Company	Revenue			Cost incurred		
	2019	2020	2021	2019	2020	2021
A	90	90	60	85	65	30
B	100	90	30	75	40	30
C	25	70	100	20	60	30
D	50	20	70	40	50	70

$$\text{Measure of A's performance in 2019} = \frac{90-85}{85} = \frac{5}{85} = 0.06$$

$$\text{Measure of B's performance in 2019} = \frac{100-75}{75} = \frac{25}{75} = 0.33$$

$$\text{Measure of C's performance in 2019} = \frac{25-20}{25} = \frac{5}{25} = 0.2$$

$$\text{Measure of D's performance in 2019} = \frac{50-40}{40} = \frac{10}{40} = 0.25$$

Company A had the lowest value.

The answer is option A.

[VIDEO SOLUTION](#)

37. A

It is given,

Company	Strength			New hires		
	2019	2020	2021	2019	2020	2021
A	150	140	150	20	35	25
B	210	240	250	35	45	30
C	320	320	320	45	40	35
D	400	410	400	30	35	40

Company A:

The number of employees in the beginning of 2019 = 150

The number of employees hired in 2019 = 20

The number of employees should be at the beginning of 2020 is $150 + 20$, i.e. 170 but there are 140 only. This implies 30 left company A in 2019.

The number of employees in the beginning of 2020 = 140

The number of employees hired in 2020 = 35

The number of employees should be at the beginning of 2021 is $140 + 35$, i.e. 175 but there are 150 only. This implies 25 left company A in 2020.

The number of employees left company A in 2019 and 2020 = $30 + 25 = 55$

Company B:

Similarly, the number of employees left company B in 2019 = $210 + 35 - 240 = 5$

The number of employees left company B in 2020 = $240 + 45 - 250 = 35$

The number of employees left company B in 2019 and 2020 = $5 + 35 = 40$

Company C:

Similarly, the number of employees left company C in 2019 = $320 + 45 - 320 = 45$

The number of employees left company C in 2020 = $320 + 40 - 320 = 40$

The number of employees left company C in 2019 and 2020 = $45 + 40 = 85$

Company D:

Similarly, the number of employees left company D in 2019 = $400 + 30 - 410 = 20$

The number of employees left company D in 2020 = $410 + 35 - 400 = 45$

The number of employees left company D in 2019 and 2020 = $20 + 45 = 65$

The total number of employees lost in 2019 and 2020 is least for company B.

The answer is option A.

 VIDEO SOLUTION

38. C

It is given,

Company	Revenue			Cost incurred		
	2019	2020	2021	2019	2020	2021
A	90	90	60	85	65	30
B	100	90	30	75	40	30
C	25	70	100	20	60	30
D	50	20	70	40	50	70

	Strength			New hires		
Company	2019	2020	2021	2019	2020	2021
A	150	140	150	20	35	25
B	210	240	250	35	45	30
C	320	320	320	45	40	35
D	400	410	400	30	35	40

$$\text{Company A} = \frac{90-65}{145} = \frac{25}{145} = \frac{5}{29}$$

$$\text{Company B} = \frac{90-40}{245} = \frac{50}{245}$$

$$\text{Company C} = \frac{70-60}{320} = \frac{10}{320}$$

Company B had the highest profit per employee.

The answer is option C.

[VIDEO SOLUTION](#)

39. D

The Pat per employee for the firm in 2023 will be:

$$\text{Firm E: } \frac{3500}{1400} = \frac{35}{14} = \frac{5}{2}$$

$$\text{Firm A: } \frac{3900}{1300} = 3$$

$$\text{Firm F: } \frac{3200}{1000} = 3.2$$

$$\text{Firm C: } \frac{3000}{800} = \frac{15}{4} = 3.75$$

The value if maximum for firm C, therefore, Option D is the correct answer.

[VIDEO SOLUTION](#)

40. C

Since we are given that the annual growth rate should be taken as constant, we can simply compare the ratio changes in the firm's PAT in 2019 and 2023 and compare them.

$$\text{Firm A: } 3000 \text{ to } 3900; \text{ an increase of } 900, \text{ giving the growth rate to be } \frac{900}{3000} = \frac{3}{10} = 0.3$$

$$\text{Firm C: } 2400 \text{ to } 3000; \text{ an increase of } 600, \text{ giving the growth rate to be } \frac{600}{2400} = \frac{1}{4} = 0.25$$

$$\text{Firm E: } 2400 \text{ to } 3500; \text{ an increase of } 1100, \text{ giving the growth rate to be } \frac{1100}{2400} = \frac{11}{24} \approx 0.45$$

$$\text{Firm B: } 2800 \text{ to } 3800; \text{ an increase of } 1000, \text{ giving the growth to be } \frac{1000}{2800} = \frac{5}{14} \approx 0.35$$

We can see that of the given ratios, the growth rate is highest for firm E (closest to 0.5). Therefore, the highest ARG, among the given options, will be for firm E.

Therefore, Option C is the correct answer.

Accurate analysis of your profile

41. D

This can be a little difficult to solve since the bubbles are not closed within a fixed boundary, but in such instances, we should approximate the most visible cases.

Like the bubble of C in 2019 is almost 3 units vertically long in diameter, while that in 2023 is 2 units long.

The ratio of the amount spend on R&D on 2019 to 2024 would be given by: $\frac{2400\pi(1.5)^2}{3000\pi(1)^2} = \frac{8}{10} \times \frac{9}{4} = 9 : 5$

Which is option D.

 VIDEO SOLUTION

42. **B**

We calculated the PAT per employee for F, C and E in the last question, using that information and calculating the PAT per employee for firm D to be $\frac{2400}{800} = 3$

For firms F, C and D, we can see that the area is the same hence the only factor to consider is PAT per employee F is 3.2, C is 3.75, and D is 3

This leaves D as the minimum.

Comparing E and D (taking the proportionality constant as k)

E has PAT per employee as 2.5 with a radius of 1.5 units, the PRD value per employee would be $\frac{5}{2}k\pi \left(\frac{3}{2}\right)^2 = k\pi \times \frac{5 \times 9}{8}$

D has PAT per employee as 3, with a radius of 1 unit. the PRD value per employee would be $3k\pi (1)^2 = 3k\pi$

We can see that the value would be greater for E, therefore firm D will have the lowest R&D spending per employee in 2023

Therefore, Option B is the correct answer.

 VIDEO SOLUTION

43. **6**

Comparing the 1st and 2nd graphs, we should be able to determine the type of puzzle.

From the second graph, we can say that there are 4 visual-based puzzles in total, which makes the number-based puzzles 6.

Let us follow the green line in both graphs:

The 1st visual-based puzzle was completed by Green in 2 minutes from the 2nd graph. From the 1st graph at the 2nd minute, the puzzle that was solved by Green was 1. So, we can say that 1 is a visual-based puzzle.

The 2nd visual-based puzzle was completed by Green in 12 minutes from the 2nd graph. From the 1st graph at the 12th minute, the puzzle that was solved by Green was 4. So, we can say that 4 is a visual-based puzzle.

The 3rd visual-based puzzle was completed by Green in 25 minutes from the 2nd graph. From the 1st graph at the 25th minute, the puzzle that was solved by Green was 8. So, we can say that 8 is a visual-based puzzle.

The 4th visual-based puzzle was completed by Green in 29 minutes from the 2nd graph. From the 1st graph at the 29th minute, the puzzle that was solved by Green was 9. So, we can say that 9 is a visual-based puzzle.

We can conclude that puzzles 1, 4, 8, and 9 are visual-based, while puzzles 2, 3, 5, 6, 7, and 10 are number-based.

The fourth number-based puzzle is 6th puzzle in the order.

Hence, the correct answer is 6.

 VIEW SOLUTION

44. **B**

The left plot shows, for each competitor, a step (staircase) curve whose height at any time t equals the number of puzzles that competitor has completed by minute t.

To find who solved the most puzzles by the 20th minute, draw a vertical line at t=20 (or simply read the height of each competitor's colored stair at the vertical line x=20).

Reading the four curves at $t=20$:

The green staircase (Koushik) is at the highest horizontal level at $t=20$.

The yellow (Chandranath) and red (Anirbid) staircases are lower than the green ones at that time.

The blue (Suranjan) staircase is the lowest of the four at $t=20$.

Since Koushik's value is greater than every other competitor's at $t=20$, Koushik has solved the largest number of puzzles by the 20th minute.

Hence, the correct answer is option B.

[VIEW SOLUTION](#)

45. D

Comparing the 1st and 2nd graphs, we should be able to determine the type of puzzle.

From the second graph, we can say that there are 4 visual-based puzzles in total, which makes the number-based puzzles 6.

Let us follow the green line in both graphs:

The 1st visual-based puzzle was completed by Green in 2 minutes from the 2nd graph. From the 1st graph at the 2nd minute, the puzzle that was solved by Green was 1. So, we can say that 1 is a visual-based puzzle.

The 2nd visual-based puzzle was completed by Green in 12 minutes from the 2nd graph. From the 1st graph at the 12th minute, the puzzle that was solved by Green was 4. So, we can say that 4 is a visual-based puzzle.

The 3rd visual-based puzzle was completed by Green in 25 minutes from the 2nd graph. From the 1st graph at the 25th minute, the puzzle that was solved by Green was 8. So, we can say that 8 is a visual-based puzzle.

The 4th visual-based puzzle was completed by Green in 29 minutes from the 2nd graph. From the 1st graph at the 29th minute, the puzzle that was solved by Green was 9. So, we can say that 9 is a visual-based puzzle.

We can conclude that puzzles 1, 4, 8, and 9 are visual-based, while puzzles 2, 3, 5, 6, 7, and 10 are number-based.

The average time taken by Anirbid to solve the number-based puzzles can be calculated as,

Time for 1st number-based puzzle(2nd puzzle) from 1st graph = $9 - 4 = 5$ minutes.

Time for 2nd number-based puzzle(3rd puzzle) from 1st graph = $11 - 9 = 2$ minutes.

Time for 3rd number-based puzzle(5th puzzle) from 1st graph = $19 - 14 = 5$ minutes.

Time for 4th number-based puzzle(6th puzzle) from 1st graph = $22 - 19 = 3$ minutes.

Time for 5th number-based puzzle(7th puzzle) from 1st graph = $27 - 22 = 5$ minutes.

Time for 6th number-based puzzle(10th puzzle) from 1st graph = $37 - 33 = 4$ minutes.

$$\text{Average} = \frac{5 + 2 + 5 + 3 + 5 + 4}{6} = \frac{24}{6} = 4 \text{ minutes}$$

The average time taken by Anirbid to solve the number-based puzzles is 4 minutes.

Hence, the correct answer is option D.

CAT Percentile Predictor

46. 2

Comparing the 1st and 2nd graphs, we should be able to determine the type of puzzle.

Then, actual rainfall in 2009 = 500mm

As deviation is +25% so average 2009 - 2018 is $600/1.25 = 480$

LPA 2019 = $(480 \times 10 - 500 + 600)/10 = 490\text{mm}$

Answer C

 VIDEO SOLUTION

51. D

We can make the following table from the web chart given in the question:

Revenue				Cost			
	Clothing	Produce	Electronics		Clothing	Produce	Electronics
2016	20	30	50		30	40	30
2017	30	40	30		30	30	40
2018	40	40	20		20	50	30

If we consider the total cost in the year

2016 as 100, then according to Statement 1, the total revenue in 2016 must be 200.

The store's revenue doubled from 2016 to 2017, thus the total revenue in the year 2017 = 400.

We can find the revenue for the individual department in the year 2017, from the table.

There was no profit from the Electronics department in 2017, thus, we can find the total cost in 2017 = 300

Considering the statement 4, we can find the total revenue in 2018 and tabulate the following table.

Cost							
	Clothing		Produce		Electronics		Total
2016	30%	30	40%	40	30%	30	100
2017	30%	90	30%	90	40%	120	300
2018	20%	40	50%	100	30%	60	200

Revenue							
	Clothing		Produce		Electronics		
2016	20%	40	30%	60	50%	100	200
2017	30%	120	40%	160	30%	120	400
2018	40%	100	40%	100	20%	50	250

The ratio of revenue generated from the Produce department in 2017 to that in 2018 = $160:100 = 8:5$

 VIDEO SOLUTION

52. 70

We can make the following table from the web chart given in the question:

Revenue				Cost			
	Clothing	Produce	Electronics		Clothing	Produce	Electronics
2016	20	30	50		30	40	30
2017	30	40	30		30	30	40
2018	40	40	20		20	50	30

If we consider the total cost in the year

2016 as 100, then according to Statement 1, the total revenue in 2016 must be 200.

The store's revenue doubled from 2016 to 2017, thus the total revenue in the year 2017 = 400.

We can find the revenue for the individual department in the year 2017, from the table.

There was no profit from the Electronics department in 2017, thus, we can find the total cost in 2017= 300

Considering the statement 4, we can find the total revenue in 2018 and tabulate the following table.

Cost							
	Clothing		Produce		Electronics		Total
2016	30%	30	40%	40	30%	30	100
2017	30%	90	30%	90	40%	120	300
2018	20%	40	50%	100	30%	60	200

Revenue							
	Clothing		Produce		Electronics		
2016	20%	40	30%	60	50%	100	200
2017	30%	120	40%	160	30%	120	400
2018	40%	100	40%	100	20%	50	250

Profit in 2016 = $200 - 100 = 100$

Profit in the electronic department in 2016= $100 - 30 = 70$

The total profits= for the store in 2016 were from the Electronics department 70%

 VIDEO SOLUTION

53. C

We can make the following table from the web chart given in the question:

Revenue				Cost			
	Clothing	Produce	Electronics		Clothing	Produce	Electronics
2016	20	30	50		30	40	30
2017	30	40	30		30	30	40
2018	40	40	20		20	50	30

If we consider the total cost in the year

2016 as 100, then according to Statement 1, the total revenue in 2016 must be 200.

The store's revenue doubled from 2016 to 2017, thus the total revenue in the year 2017 = 400.

We can find the revenue for the individual department in the year 2017, from the table.

There was no profit from the Electronics department in 2017, thus, we can find the total cost in 2017= 300

Considering the statement 4, we can find the total revenue in 2018 and tabulate the following table.

Cost							
	Clothing		Produce		Electronics		Total
2016	30%	30	40%	40	30%	30	100
2017	30%	90	30%	90	40%	120	300
2018	20%	40	50%	100	30%	60	200

Revenue							
	Clothing		Produce		Electronics		
2016	20%	40	30%	60	50%	100	200
2017	30%	120	40%	160	30%	120	400
2018	40%	100	40%	100	20%	50	250

Profit percentage in 2017 = $(400-300)/300\% = 33.33\%$

Profit percentage in 2018 = $(250-200)/200\% = 25\%$

The approximate difference in profit percentages of the store in 2017 and 2018 = $(33.33-25)\% = 8.33\%$

Option C.
